

SQL Server (t-sql)

This Course will give In-depth
Information related to t-sql language

Author: Lokanatha Palle

Date: 12-Dec-2017

sql server overview

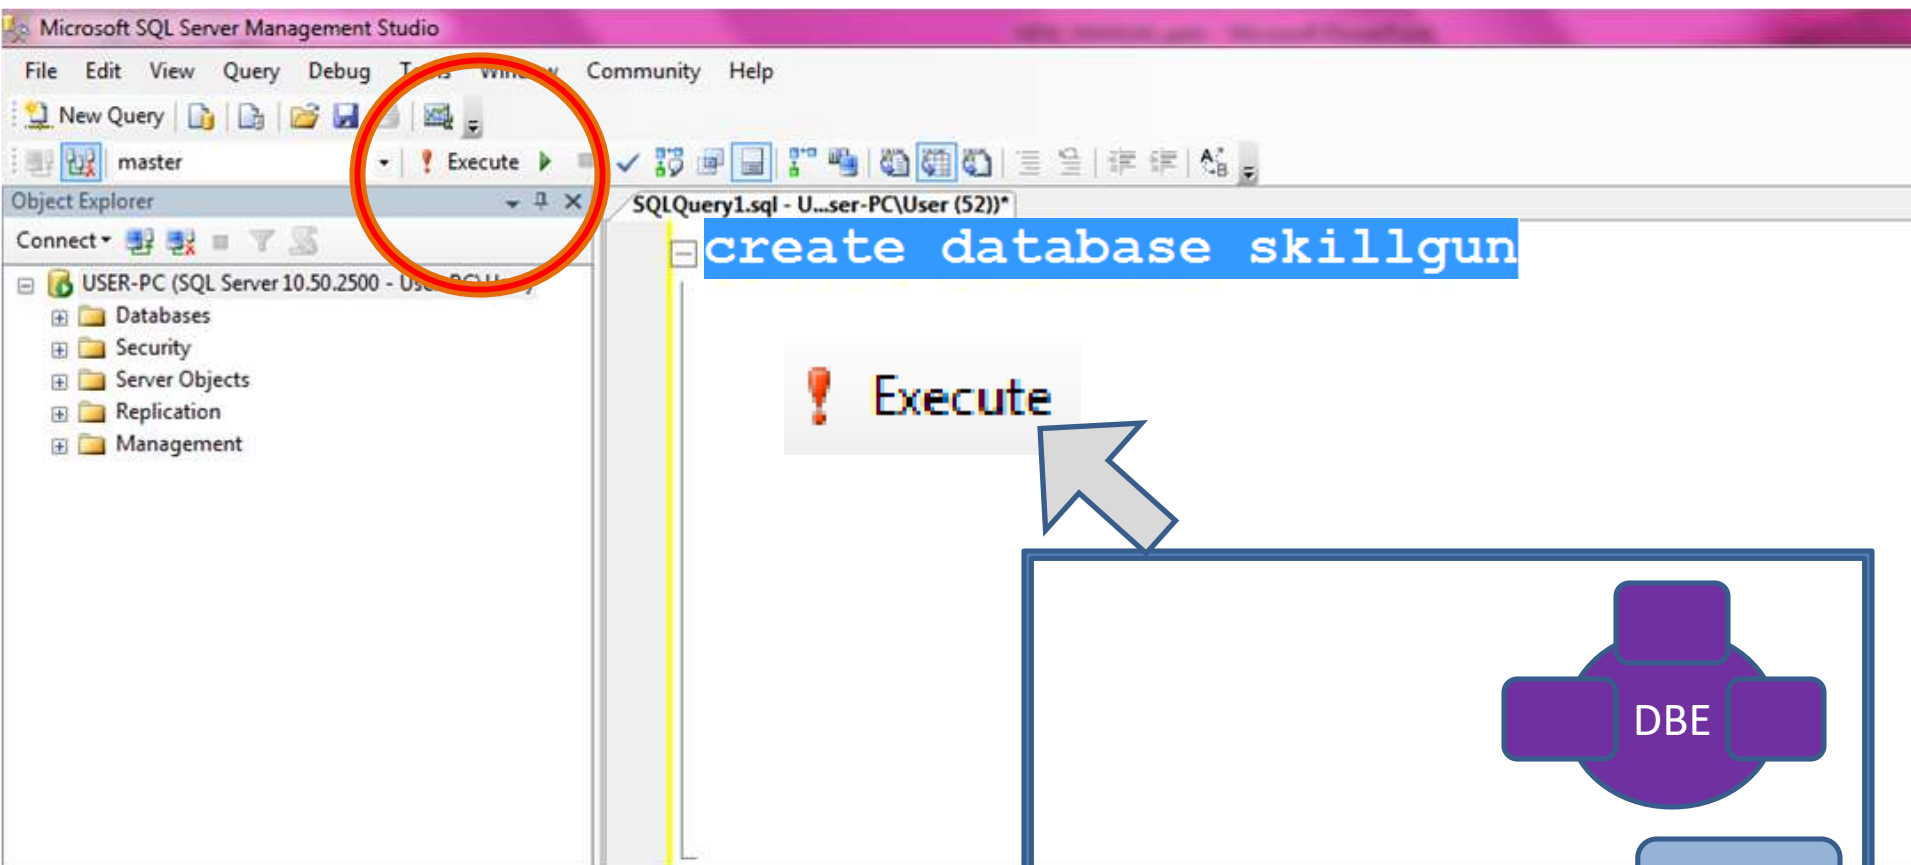

USER-PC\SQLEXPRESS (SQL Server 10.0.2531)

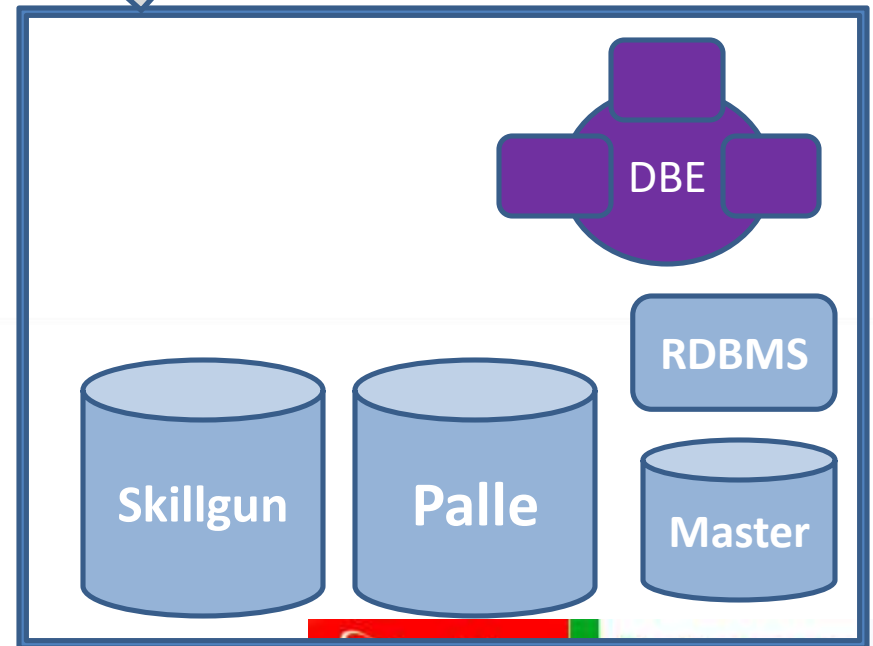

- + Databases
- + Security
- + Server Objects
- + Replication
- + Management

SQLQuery1.sql - USER-PC\...\User (52))

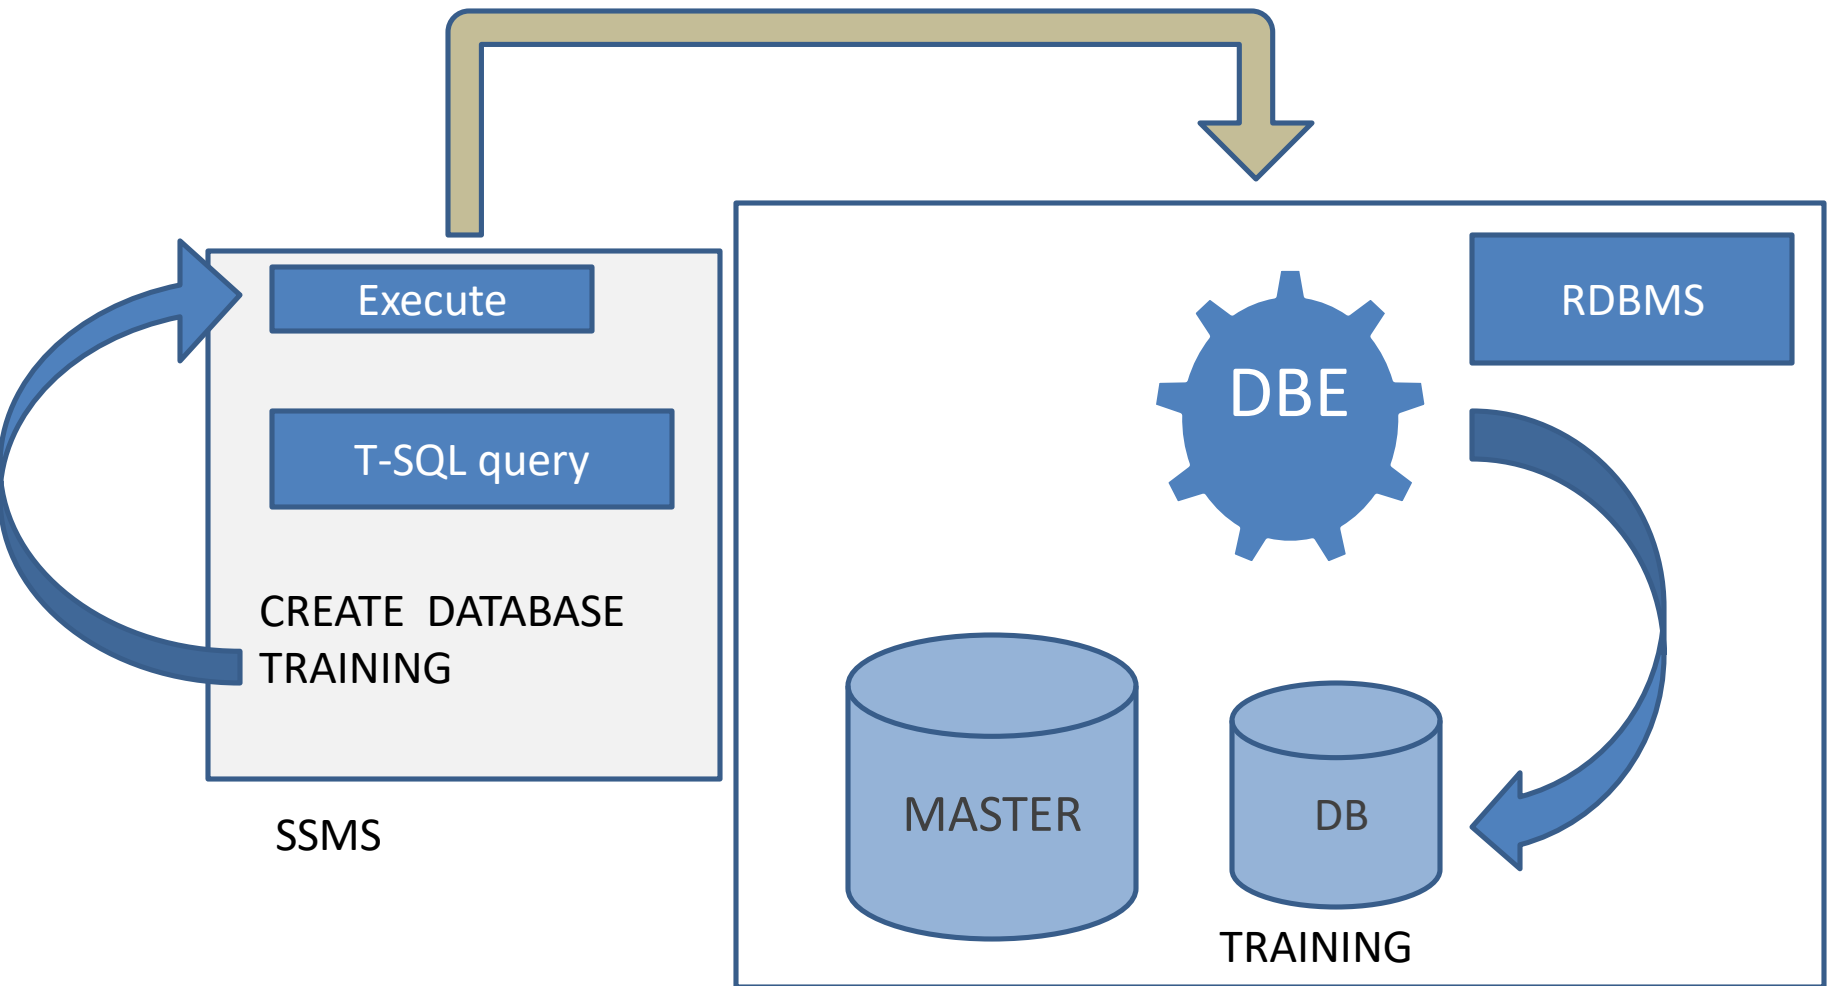

Creating a Data base

Command(s) Successful

SSMS and SQL Server Communication

Data types in T-SQL

- Int
- Small int
- Bigint
- Tinyint
- Decimal
- Char
- Nchar
- Varchar
- Nvarchar
- Varchar(max)
- Binary
- Varbinary(max)
- Datetime
- Date
- Time
- Smalldatetime
- datetime2
- Money
- Smallmoney
- bit
- Timestamp
- Table
- Real
- Numeric
- Sql_variant
- xml

Datatypes	Size in bytes
<ul style="list-style-type: none"> Tinyint Smallint Int Bigint decimal 	<p>1 byte</p> <p>2 bytes</p> <p>4 bytes</p> <p>8 bytes</p> <p>Can store upto 38 digits all can be after decimal point</p>
<ul style="list-style-type: none"> Char Varchar Varchar(max) Bit 	<p>Can store max 8000 characters</p> <p>Can store upto 8000 characters</p> <p>Can store upto 2^{31} characters</p> <p>1 bit (can store either 0 or 1)</p> <p>Note: usually used to store true or false</p>

Difference b\w char and nchar

Char

- we can store up to 8000 chars
(can be English + special+
numeric)

Nchar

- can store up to 8000
characters
- we are allowed to store
**(Globalized character+ English
+ special+ numbers)**

difference b/w char and varchar datatypes

char

- Fixed size datatype
- declare @c char(10);
Set @c = 'ABC'

varchar

- Varying size datatype
- declare @v varchar(10);
Set @v = 'ABC';

Table

- Tables are the combination of Rows and Columns

Table = Row+Column

- Rows = tuples
- Columns = Attributes
or properties

Table creation syntax

```
Create    table    <table_name>
(
Column1    datatype1[(Size)],
Column2    datatype2,
Column3    datatype3,
.....
)
```

Note: As per industry standards table names and column names must not be plurals.

table creation sample

Req:create a student table to store students details
sid,name,class,dob

Int	vc(40)	vc(40)	date
sid	name	class	dob

student

```
create table student(  
sid int,  
name varchar(40),  
class varchar(40),  
dob date  
)
```

```
insert into student values(1,'Rajeev','9th class','10-4-1999');  
insert into student values(2,'Veena','10th class','11-5-1998');
```

table creation assignment

- write code for implementing the following set of items?
- create a table with the name products and with column names (**pid**→int, **pname**→varchar(40),**cost**→int, **manufacturer_name**→varchar(40), **manufactured_date**→date)
- the table must be created in PalleTraining DB (assuming that the DB is already available in your sql server).
- insert the following data into products table.
 - 1, lux, 34, HUL, dec-12-2017
 - 2, locks, 1200, Godrej, Jan-11-2018
- write query for displaying data present in product table

constraints Part1

- using constraints we can limit the data which is coming into table columns.
- t-sql supports following constraints

not null

default

check

primary
key

unique

foreign
key

Default Constraints

Default constraints are useful for inserting default values when user does not supply any value

```
Create table student  
(  
  Sid int,  
  Name varchar(40),  
  City varchar(40) default 'bangalore '  
)
```

Default banglore		
Sid	Name	City
101	Raj	chennai
103	Veena	Bangalore

```
insert into student values (101, 'Raj', 'chennai')
```

```
insert into student (sid, Name) values (103, 'veena')
```

NotNull Constraints

When you set the not null constraint to a specific column , that column will not allow null value

```
create table employee
(
  Eid int not null,
  Name varchar(40),
  Email varchar(40)
)
```

NOT NULL

Eid	Name	Email
1	ravi	r@gmail.com
2	NULL	NULL

```
insert into employee values (1, 'ravi', 'r@gmail.com') ✓
insert into employee values (2, null, null) ✓
insert into employee values (null, 'suresh', 's@gmail.com') ✗
```

Not null constraint will not allow null values.

Check Constraints

By using check constraints we can limit the Range of permissible values into specific column

Req: Create a table with employee details eid, Name, Age_in_years (Age must be between 18 to 60)

```
create table employee(  
  eid int,  
  name varchar(40),  
  Age_in_yrs int check(Age_in_yrs between 18 and 60)  
)
```

Do You think that DBE will accept this command?

18 - 60

```
insert into employee values (103, 'Madhav', 17);
```

eid	name	Age_in_yrs
103	Madhav	17

x

x Error

DBE will not Accept this Command

eid	name	Age_in_yrs
101	Raj	25

Whether DBE will accept this values?

Primary Key

- primary key gives uniqueness to the tables rows
- only one primary key is allowed per table
- primary key will not allow null values and duplicate values

Lets see a sample

```
create table customer  
(  
  Cid int primary key,  
  Cname varchar(40),  
  Cust_email varchar(50)  
)
```

```
insert into customer values (2, 'suresh', 's@gmail.com')
```

Primary Key		
Cid	Cname	Cust_email
1	Ram	ram@gmail.com
2	Maha	maha@gmail.com

customer

Duplicate values are not allowed

ERROR

unique

- unique constraint gives uniqueness to the tables rows
- any number of unique constraints are allowed per table
- unique constraint will not allow duplicate values and allows only one null value

```
create table customer  
(  
  Name varchar(40) unique,  
  Cell_No int unique,  
  Product varchar(40)  
)
```

Unique

CUSTOMER		
Name	Cell_No	Product
<u>Ram</u>	9943300821	Toothbrush
maresh	<u>NULL</u>	Soap

CUSTOMER

```
insert into customer values ('Ram', 9865226020, 'shampoo')  
insert into customer values ('mahi', null, 'lux');
```

ERROR

Composite primary key

When we apply primary key constraint on more than one column, then it is called Composite primary key.

```
Create table customer
(
  Name varchar(40),
  Dob date,
  Product varchar(40),
  Constraint cpk
  primary key(Name ,Dob)
)
```

primary key

Varchar(40)	date	Varchar(40)
Name	Dob	Product
Ravi	10-8-2017	toothbrush
maresh	10-8-2017	lux soap
Ravi	10-8-2018	lion dates

CUSTOMER

```
insert into customer values('Ravi','10-8-2018','lion dates');
insert into customer values('Ravi','10-8-2017','lux');
```

how many PK's are created in the table
Only 1 PK for 2 columns.

ERROR
Technologies

Difference between primary key and unique

Primary key

- Only one primary key is allowed per table
- Will not allow NULL values
- It will internally create clustered index. (we will understand later)

Unique

- Any number of unique constraints are allowed/table
- Will allow one NULL value
- Unique will create non clustered index.

Constraints assignment

Int	varchar(40)	int	varchar(10)	int	varchar(40)
Eid	Name	salary	bg	age	email
4	ravi	36000	O+ve	48	ravi@gmail.com
6	suresh	38000	O+ve	56	null

Req:

- 1.Eid column must not allow any duplicate or null values
- 2.Name column must not allow any null values
- 3.Bg should have default value as o+ve
- 4.Age should have range from 18-60 years
- 5.Email column should allow only one null value and no duplicate values

Normalization

- using normalization we can reduce the data duplication or data redundancy.
- usually normalization process involves splitting a single table into multiple tables.
- It is recommended to create a new table for storing predictable repeating data .
- Ex: blood group names, state names / province names in a country.....
- normalization is used for avoiding the insert/update/delete anomaly or inconsistency

Consider this **student** table for understanding normalization

(PK) \rightarrow $\text{VC}(40)$ $\text{VC}(40)$

Sid	Name	State
1	Rajeev	Karnataka
2	mohesh	Uttarpradesh
3	Veena	Kerala
4	Vani	Andhra Pradesh
5	Kishore	Karnataka
6	Madhav	Karnataka

5000 = Students

- Assume this table consist of 5000 records
- Observe the table and tell me , is there any data duplication (repetition of same data)

The state column data are duplicated , and tell me is state column data are predictable?

Definitely the state column data are predictable data, because we have only 29 states in our country. All the 5000 students must belong to any 1 of 29 states.

Memory required for storing 1 state name is,

Then for storing all the state names how much memory is required ??

Very huge memory is required

2000 \rightarrow Karnataka \rightarrow 9 Char's \rightarrow 2 bytes \times 9 = 18 bytes
 2000 \times 18 \Rightarrow 36000 bytes

How can we avoid this duplication,

By splitting the single table into two tables

Now i have created 1 separate table for storing all the state names, and I have given a unique id for each state

PK int

VC(40)	VC(40)
Stid	StName
1	Karnataka
2	Andhrapradesh
3	Kerala
4	Tamilnadu
5	Uttarapradesh
<u>29</u>	<u>Telangana</u>

States

PK int

VC(40)	VC(40)	VC(40)
Sid	Name	State
1	Rajeev	Karnataka
2	mahesh	Uttarpradesh
3	Veena	Kerala
4	Vani	Andhra pradesh
5	Kishore	Karnataka
<u>6</u>	<u>Madhav</u>	<u>Karnataka</u>

5000 = Students

Now I will create a student table and in place of state column , I will give the state id.

UnNormalized table

PK int PK int

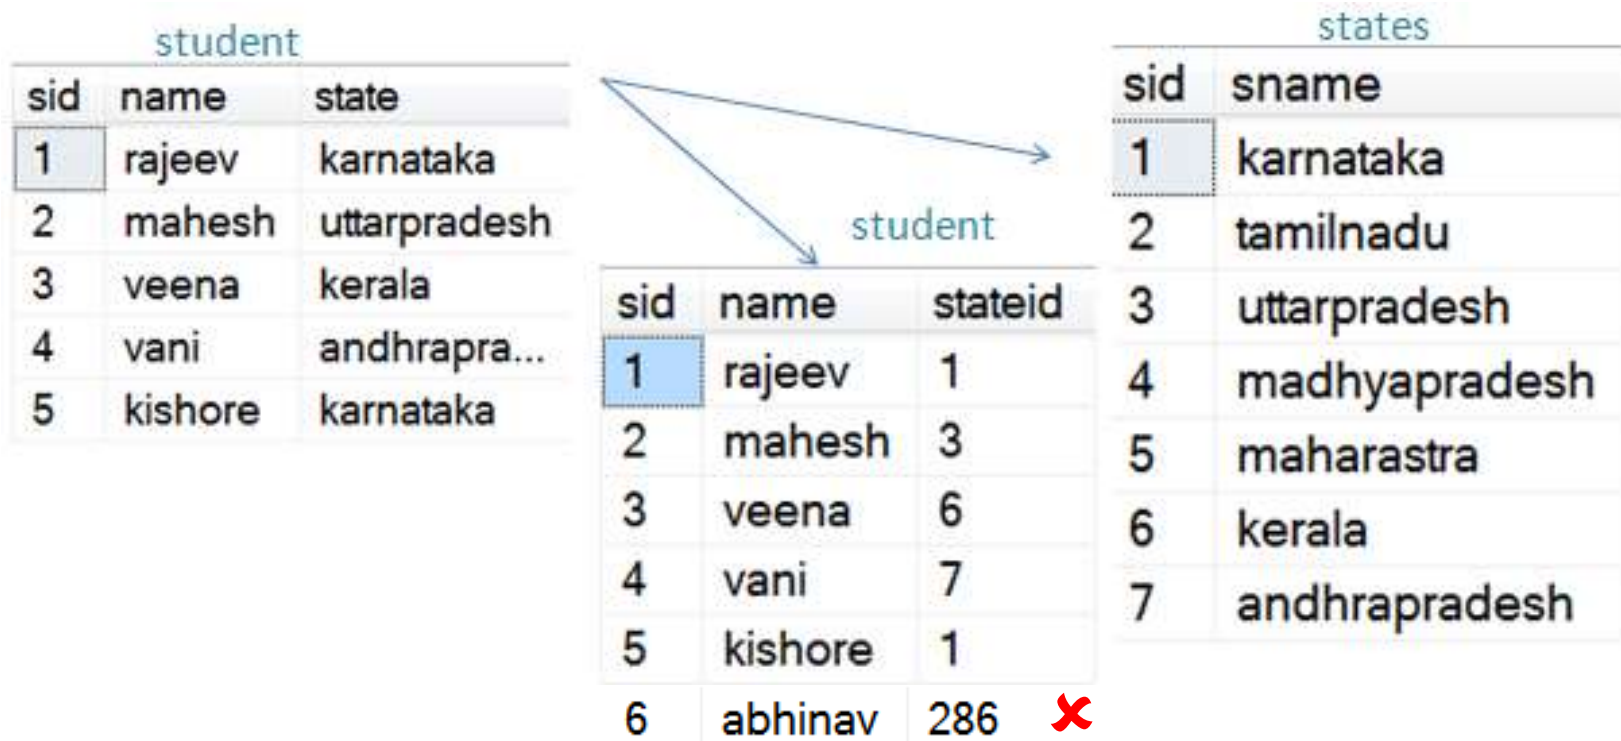

VC(40)	VC(40)	int
Sid	Name	State Id
1	Rajeev	1
2	mahesh	5
<u>3</u>	<u>Veena</u>	<u>3</u>

We have reduced the data duplication by using the normalization technique

Foreign key constraint

- Using Foreign key constraint we link / relate 2 or more tables.
- We can achieve referential integrity

When we are normalizing the tables there are chances for getting insert and update anomaly

```
insert into student values (6, 'abhinav', 286)
```

To eliminate this problem, we will be using Foreign key constraint

- Foreign key will allow null values
- Any number of Foreign key constraints can be created per table
- Any Fk column mapped to other column from any table must be defined with either with primary key or unique constraints

Syntax

Create table table_name

(

Col1 datatype Foreign key references table_name(column_name)

Col2 datatype

)

create table state

(

sid int primary key,

statename varchar(40)

)

create table student

(

sid int,

name varchar(40),

stateid int

)

insert into student values (6, 'abhinav', 286)

Primary key ←

state	
sid	statename
1	karnataka
2	tamilnadu
3	uttarpradesh
4	madhyapradesh
5	maharastra
6	kerala
7	andhrapradesh

Example

How will you link the columns

sid	name	stateid
1	rajeev	1
2	mahesh	3
3	veena	6
4	vani	7
5	kishore	1

Normalization lab1

- Normalize the employee2 table use foreign key

eid	ename	age	bg	state
1	madhesh	25	o+ve	karnataka
2	suresh	24	o-ve	andhrapradesh
3	veena	30	o-ve	karnataka
4	kiran	35	b+ve	karnataka
5	ravi	25	b+ve	kerala

Lab 1 solution

Blood_group

id	bg
1	o+ve
2	o-ve
3	b+ve
4	b-ve

state

state_id	state_name
1	karnataka
2	tamilnadu
3	california
4	andhrapradesh
5	kerala

Foreignkey

Foreignkey

employee2

eid	ename	age	bg	state
1	madhesh	25	o+ve	karnataka
2	suresh	24	o-ve	andhrapradesh
3	veena	30	o-ve	karnataka
4	kiran	35	b+ve	karnataka
5	ravi	25	b+ve	kerala

New_employee2

eid	ename	age	bg	state
1	madhesh	25	1	1
2	suresh	24	2	4
3	veena	30	2	1
4	kiran	35	3	1
5	ravi	25	3	5

Un-normalized employee table

Normalized employee table

Normalization Lab 2

- Normalize the student table and use foreign key

id	name	city	state	country
1	kumar	banglore	karnataka	india
2	mahesh	mysore	karnataka	india
3	vishnu	banglore	karnataka	india
4	paul	San Franscisco	California	us
5	basker	chennai	tamilnadu	india

Wrong solution

cid	c_name
1	banglore
2	chennai
3	mysore
4	San Franscisco
5	hyderabad

state_id	state_name
1	karnataka
2	tamilnadu
3	california
4	andhrapradesh
5	kerala

country_id	country_name
1	india
2	united states

F.K

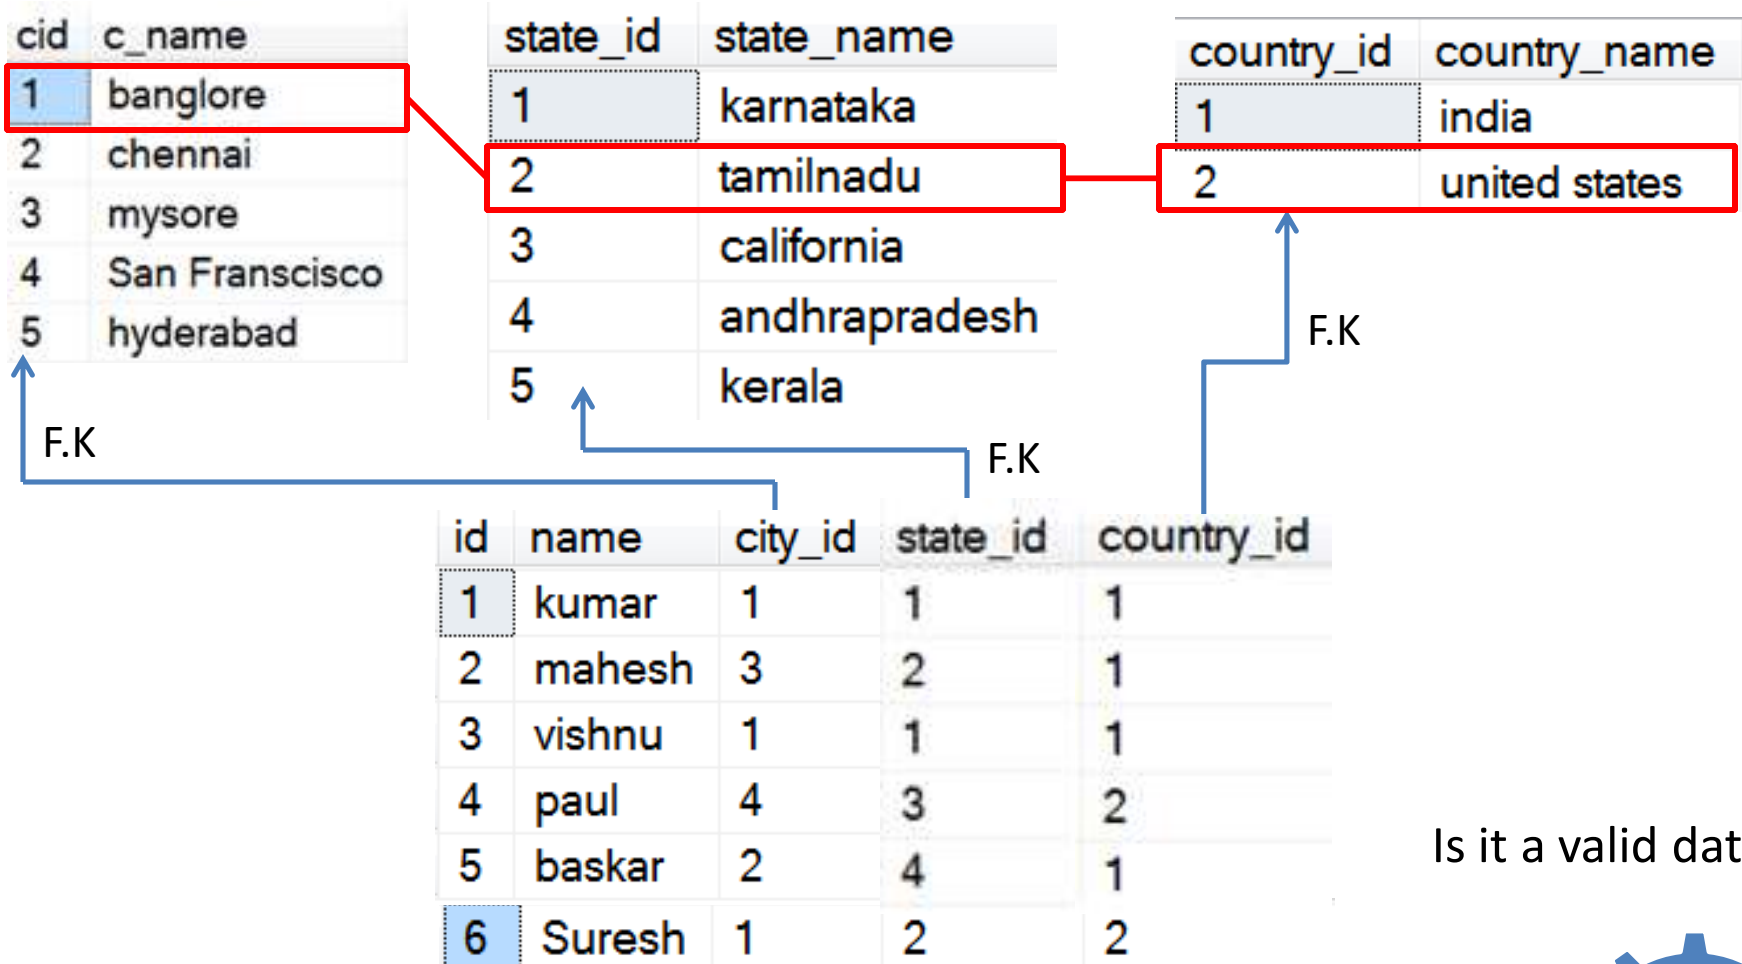

F.K

F.K

id	name	city_id	state_id	country_id
1	kumar	1	1	1
2	mahesh	3	2	1
3	vishnu	1	1	1
4	paul	4	3	2
5	baskar	2	4	1

Wrong solution

Why?

Is it a valid data?

Assume we are trying to insert

```
insert into student values (6, 'Suresh', 1, 2, 2)
```

Normalized student table

student

id	name	city_id
1	kumar	1
2	mahesh	3
3	vishnu	1
4	paul	4
5	baskar	2

Solution

Un-normalized student table

student

id	name	city	state	country
1	kumar	banglore	karnataka	india
2	mahesh	mysore	karnataka	india
3	vishnu	banglore	karnataka	india
4	paul	San Franscisco	California	us
5	basker	chennai	tamilnadu	india

F.K

F.K

F.K

country

cid	c_name	state_id
1	banglore	1
2	chennai	2
3	mysore	1
4	San Franscisco	3
5	hyderabad	4

city

sid	statename	country_id
1	karnataka	1
2	tamilnadu	1
3	andhrapadesh	1
4	california	2
5	kerala	1

state

country_id	country_name
1	india
2	united states

Normalization lab3-Solution

Types Of t-sql Statements

- t-sql statements categorized into
- DML Statements(Insert, Update, Delete, Select * into)
- DDL Statements (Create, Alter)
- DQL Statements (All Select statements except select * into)
- TCL Statements (Commit, Rollback)
- DCL Statements (Grant, Revoke used only by DBA's not by DB Programmers)

Generic Select Statement

SELECT select_list

[INTO new_table_name]

FROM table_list

[WHERE search_conditions]

[GROUP BY group_by_list]

[HAVING search_conditions]

[ORDER BY order_list [ASC | DESC]]

Select sample 1

employee

eid	fname	lname	age	salary	dept	doj
1	rajeev	sukla	23	12000	.net	2011-10-23
2	sowmya	kumari	23	19000	db	2010-11-13
3	kishore	kumar	27	36000	android	2011-10-16
4	abimanyu	biswal	22	NULL	android	2010-02-20
5	soni	kumar	24	21800	.net	2009-06-21
6	anu	_singh	22	12000	db	2010-10-23
7	_dinesh	moh%anty	23	15000	.net	2009-08-26
8	nishala	_kumari	22	18000	db	2008-07-19
1	rajeev	sukla	23	12000	.net	2011-10-23

Display all employee Details.

Select * from employee

Select eid,fname,lname,age,salary,dept,doj from employee

eid	fname	lname	age	salary	dept	doj
1	rajeev	sukla	23	12000	.net	2011-10-23
2	sowmya	kumari	23	19000	db	2010-11-13

Select sample-2

write a query for producing the following result set
From employee table

Select fname+lname,age from employee

Select fname+lname as 'Fullname',age from employee

ERS

Fullname	age
rajeevsukla	23
sowmyakumari	23
kishorekumar	27
abimanyubiswal	22
==	==

No full name	age
rajeevsukla	23
sowmyakumari	23
kishorekumar	27
abimanyubiswal	22
==	==

Table : Patient

Pid → int

Fname → varchar(40)

Lname → varchar(40)

Age → int

Bg → Varchar(40)

- Table must be created without any constraints

Note: Create this table in the last pages of your note book as this table used for explaining all topics in t-sql.

pid	fname	lname	age	bg
1	madhava	reddy	45	o+ve
2	abhinav	bandra	45	o-ve
4	hari	kiran	60	b-ve
3	madhava	kiran	52	o+ve
5	veena	kumari	42	NULL
6	k_iran	kumar	39	b-ve
2	abhinav	bandra	45	o-ve
7	mahesh	nambootri	36	b+ve
8	rahul	kumar	46	b-ve
9	bharat	kumar	56	b-ve

Select Statement Lab-1

- Write a query for displaying all data present in patient table (using *)
- Write a query for displaying all columns data present in patient table without using *
- Write a query for displaying all patients fullnames, pid, age

Select Statement Lab-2

- Write a query for displaying all patients full names along with the ages by incrementing all patients age by 2 years (Sample ERS)

fullname	age
madhavareddy	47
abhinavbandra	47
harikiran	62
_____	_____
_____	_____

Select Statement Lab-3

- write a select statement for displaying the following result set?

patient details

madhava reddy's bg is o+ve and he/she is from India

abhinav bandra's bg is o+ve and he/she is from India

hari kiran's bg is b+ve and he/she is from India

madhava kiran's bg is o+ve and he/she is from India

NULL

k_kiran kumar's bg is b+ve and he/she is from India

abhinav bandra's bg is o+ve and he/she is from India

mahesh nambootri's bg is b+ve and he/she is from India

rahul kumar's bg is b+ve and he/she is from India

bharat kumar's bg is b+ve and he/she is from India

Order By Clause

- Used to **Order data** present in a **table** based on **One or more columns**.
- Use **ASC** keyword for ascending order and **DESC** for descending order.
- Default Order is ASC
- Syntax:

select_list **order by** c1 **Asc/Desc**,c2 **Asc/Desc**,..

Employees table

int	Vc(40)	Vc(40)	int	int	Vc(40)	date
eid	fname	lname	age	salary	dept	doj
1	rajeev	sukla	23	12000	.net	2011-10-23

Order By Lab-1

- Identify the output for the following query?

Select fname+lname as 'full name', age from patient
order by age

- Identify the output for the following query?

select fname, lname, bg from patient order by bg
desc

 **Note: ascii for + is 43 and for – is 45**

- Identify the output for the following query?

select fname, lname, pid from patient order by
lname, fname desc

Order By Lab-2

- Identify the result set for the following query?
`select fname,age from patient order by 'Hello'+fname+lname desc`
- write a query for displaying all patients data in the descending order of their ages?

Distinct clause

- Distinct clause is used for eliminating duplicate rows from result set
- Syntax: `distinct single column name`
or `distinct column1,column2,....`
or `distinct *`

Final result set

Draw the result set for this query

top clause Lab-1

- Identify the output for the following query?
- `select top 3 fname, lname, age from patient`
- Write a query for displaying top 3 patients details in the descending order of their age?

• ERS:

pid	fname	lname	age	bg
4	hari	kiran	60	b-ve
9	bharat	kumar	56	b-ve
3	madhava	kiran	52	o+ve

where clause

- where clause is used to filter the records present in a table.
- where clause can be applied on select or update or delete statements.
- syntax: where <condition>

For writing a condition, we have to understand the operators

operators part-1

>, >=, <, <=, !=, <>, and, or, between,
not between, in, not in, is null,
is not null, all, any

Conditional AND(&&), conditional OR(||) are not
supported in t-sql

Bitwise And(&), bitwise(|) are supported in t-sql
but we never use in real time applications

operators part-2

while using in or not in we must use set of values.

Ex: where col1 in (val1,val2,...)

while checking for null values we must use either is null or is not null

while using between or not between we must use min value first and max value later

Req: display employees details whose salary is greater than 20000

where clause lab-1

- write a query for displaying all patients details whose age is greater than 45?

`select * from patient where age>45`

- write a query for displaying all patients details whose age is between 40 and 50 (write query in all possible ways)?

`Select * from patient where age between 40 and 50`

`Select * from patient where age>=40 and age<=50`

- write a query for displaying all patients details whose age is greater than 40 and whose bg is not o+ve?
- `Select * from patient where age>40 bg!= 'o+ve'`

where clause lab-2

- write a query for displaying all patient details whose bg is not null?

```
select * from patient where bg is not null
```

- write a query for displaying all patient details whose age is equal to 42 or 36 or 60 (write query using all possible ways)?

```
select * from patient where age=42 or age=36 or age=60
```

```
select * from patient where age in (42,36,60)
```

- write a query for displaying all patient details whose age is not equal to 42 and 36 and 60 (write query using all possible ways)?

```
select * from patient where age!=42 or age!=36 or age!=60
```

```
select * from patient where age not in (42,36,60)
```

where clause lab-3

- identify the result set for the following query?

select top 3 * from patient where age>40 order
by bg desc

(student must identify which portion of the query
is executed first, also write IRS and FRS)

like clause & pattern matching

- using like clause we can find data which is matching to a specific pattern.
- syntax : **where column | expression | variable like 'pattern'**
- wildcard characters used in pattern matching

Wildcard character	description
%	0 or more characters
_	Any single character
[]	Any single character within a specified range or in a set of characters
^	Any single character not within the specified range or in a set of characters.

Like clause Lab-1

- write a query for displaying all patient details whose fname's are starting with character **m**?
- write a query for displaying all patients full names whose lname's are ending with **i**?
- write a query for displaying all patients details whose lname's are having character **a** in the second position from ending ? for ex.. kiran is having character **a** in the **second position** from **ending**

Like clause Lab-2

- write a query for displaying all patient details whose fnames are having character **r** in the 3rd position from ending?
- write a query for displaying all patient details whose fnames are having character **i** any where ?
- write a query for displaying all patient details whose fnames are starting with either **a** or **b** or **c** or **d** or **e** or **f** characters?

GENERIC INSERT,UPDATE AND DELETE STATEMENTS

USED TO MODIFY OUR TABLE DATA

syntax for generic insert statement

insert into table_name(c1,c2,c3....)

values(v1,v2,v3...)

note: insert statement will not contain where clause

syntax for generic update statement

update table_name set c1=v1,c2=v2,[where condition]

note: update statement without where will update the complete table data

syntax for generic delete statement

delete [from] table_name [where condition]

note: delete statement without where will delete all data present in a table.

Req:insert a new record into employee table with
eid=9,fname=giri, lname=babu,age=27,salary
18000,dept=.net,doj=06-24-2014

Insert into employees(eid,fname,lname,age,salary,dept,doj)
values(9,'giri','babu',27,18000,'.net','06-24-2014')

Insert Update Delete Lab-1

- write a query for inserting the following patient details into patient table?

patient id=10 fname='ahaha' lname='kumar'
age=78 bg='o+ve' (write query using all possible ways)

- write a query for inserting the following patient details into patient table?

patient id=11 fname='silli' lname='suresh'
age=81 bg is null (write query using all possible ways)

Insert Update Delete Lab-2

- write a query for updating the 10th patient (pid=10) with the following details?
fname='raja' lname='raveender' age=66
bg='o-ve'
- write a query for updating the 11th patient (pid=11) with the following details?
fname='meena' lname='kumari'
- write a query for deleting 10th and 11th patients from patient table?

delete
drop
truncate

delete without where

- a delete statement without where clause will delete complete table data.
- delete statement is a **logged operation**.
- delete operation is a **reversible operation**.
- delete operation is slow compared to truncate operation.

Patient table

Pid	FName	Lname	age	bg
1	Madhava	reddy	45	O+ve
2	Hari	kiran	60	B-ve

→ Delete patient

Similar table will be created in .ldf

Pid	FName	Lname	age	bg

Truncate table

truncate table statement will delete all data present in a table.

truncate statement is not a logged operation and hence we can't rollback this operation.

syntax: `truncate table table_name`

“truncate operation” is faster than “delete without where clause”.

truncate statement can't contain where clause

Patient Table

P_Id	FName	LName	age	bg
1	Madhava	Reddy	45	O+ve
4	Hari	kiran	60	B-ve
3	Madhava	kiran	52	O+ve
5	Veena	kumari	42	Null
6	K_iran	kumar	39	B-ve
2	Abhinav	bandra	45	O-ve
7	Mahes%h	Nambotri	36	B+ve

Table structure will not delete

Truncate table patient

.ldf

No similar table will be created in .ldf

Drop table

- drop table operation will delete the table from the database and also the related constraints and indexes.
- syntax: drop table table_name
- drop is not a logged operation

Patient Table

P_Id	FName	LName	age	bg
1	Madhava	Reddy	45	O+ve
4	Hari	kiran	60	B-ve
3	Madhava	kiran	52	O+ve
5	Veena	kumari	42	Null
6	K_iran	kumar	39	B-ve
2	Abhinav	bandra	45	O-ve
7	Mahes%h	Nambotri	36	B+ve

Table structure also
deleted

Drop table patient

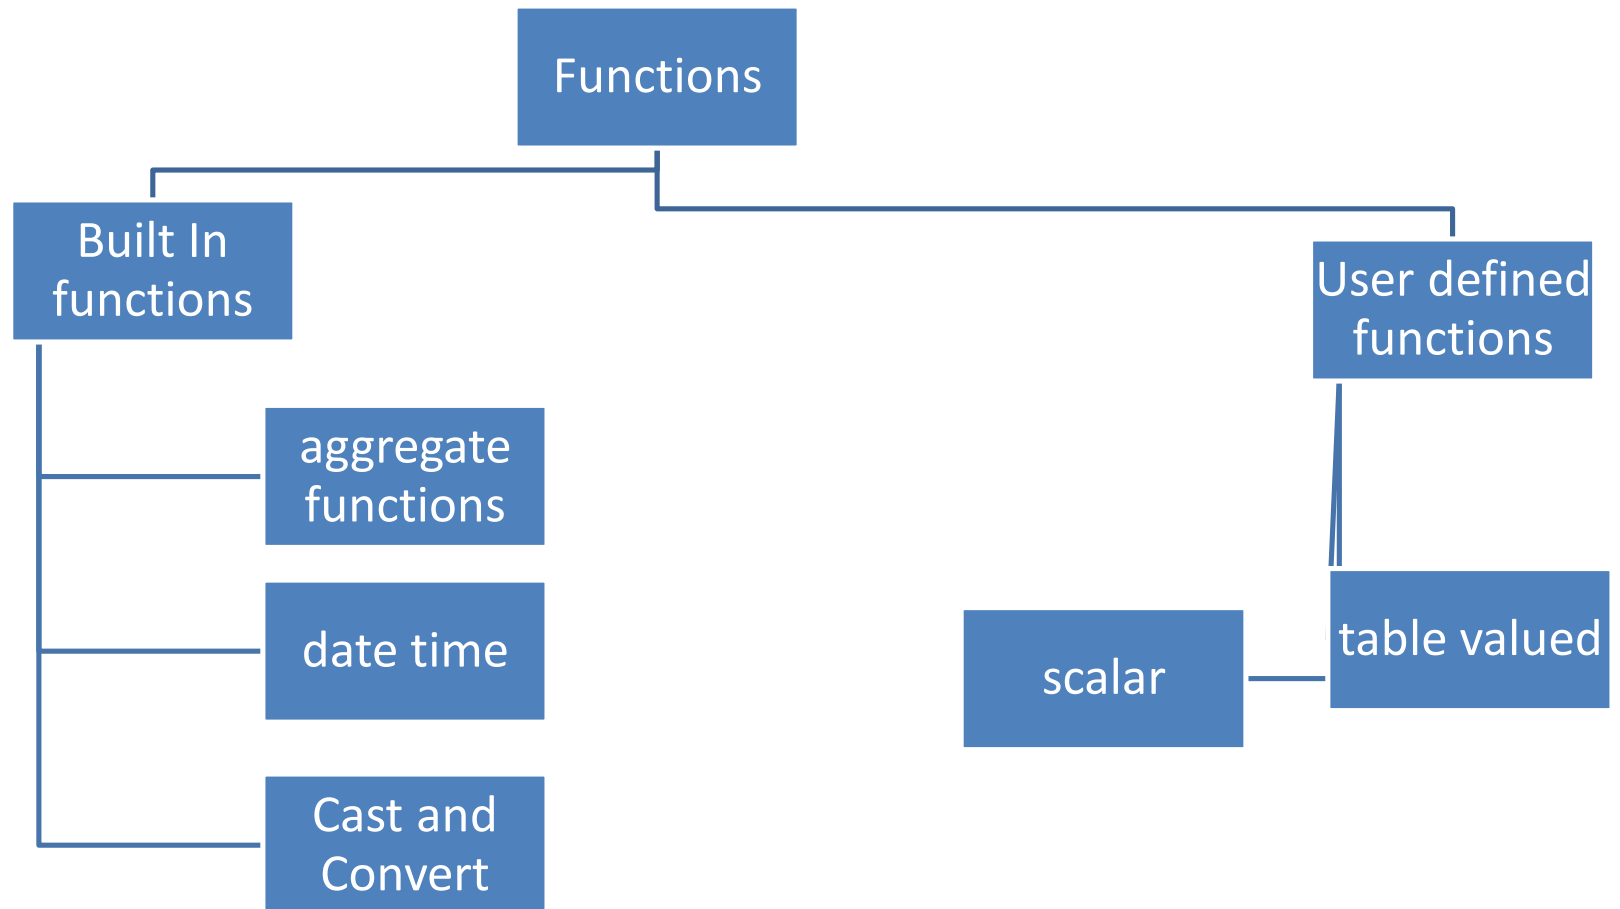

.ldf

No similar table will be created in .ldf

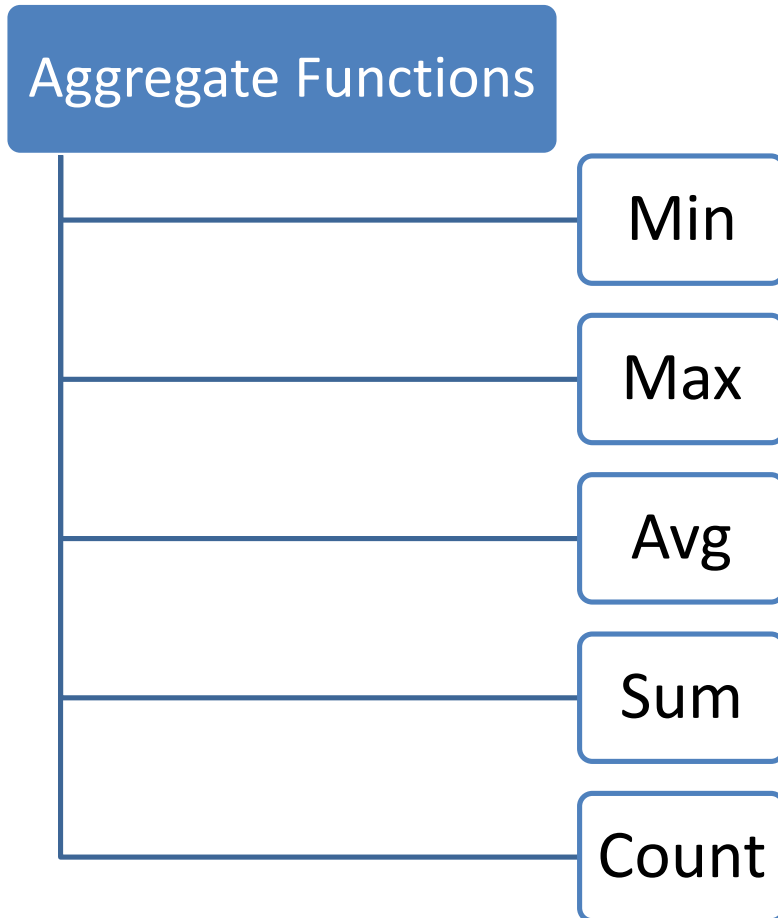

Functions

aggregate functions

Note: we are not allowed to use aggregate functions in where clause

Note2: we are not allowed to use columns in select list which are not linked with aggregate functions when any column is linked with aggregate function

14159

date time functions lab-1

- write a program for adding 8 years 3 months and 10 days to current date and display the resultant date?
- write a program for displaying difference between two dates in terms of total days difference, total months difference and total years difference.

```
declare @date1 date;  
declare @date2 date;  
set @date1='03-14-1979';  
set @date2='12-18-2017';
```

```
.....  
.....
```

ERS:

year	months	days
38	465	14159

cast and convert functions

cast function is usually used for data type conversions

cast syntax: `cast (expression as data _type[(size)])`

example:

```
declare @x int;
```

```
set @x=10;
```

```
declare @y varchar(40);
```

```
set @y='palle';
```

```
declare @r varchar(40);
```

```
set @r=@x+@y;
```

-- this code will not work since we can't concatenate int and
varchar

```
set @r=cast(@x as varchar(10)) +@y;
```

--this code will work and @r will get 10palle as its data

Convert function:

Used for converting one data type into another data type.

Syntax: CONVERT (data-type [(size)], expression-or-column-name-or-variable-name [, style])

Convert function allows formatting data while converting data. Formatting options are especially useful while using date time conversions and money conversions, since every country and culture having individual date time and money representation.

Ex: IN USA date time format is mm/dd/yyyy, in India allowed date time format is dd-mm-yyyy.

Few important date time styles:

Style	Description	Standard
0 or 100	mon dd yyyy hh:miAM (or PM)	Default
1 or 101	1 = mm/dd/yy 101 = mm/dd/yyyy	U.S.
2 or 102	2 = yy.mm.dd 102 = yyyy.mm.dd	ANSI
3 or 103	3 = dd/mm/yy 103 = dd/mm/yyyy	India/British/French

Note: usually single digit and double digit style number will display year number without century (ex 15 instead of 2015) except 0, 9, 13, 20 and 21.

Example for convert:

```
declare @x int;
```

```
set @x=20;
```

```
declare @y varchar(40);
```

```
set @y='palle university';
```

```
set @y=@x+@y;
```

-- this code will not work since we can't concatenate int and varchar

```
set @y=convert(varchar(10),@x) +@y;
```

--this code will work and @y will get its value as 20palle university

display doj in Indian style from employee table

Query: Select doj convert(varchar(40),doj,103)
from employees

Output:

Doj
23-10-2011
21-06-2009
.....

Destination datatype

Indian style:dd/mm/yyyy

cast and convert function lab-1

- write a query for displaying the concatenated result of all patient columns data as shown below(must consider this as 2 assignments one by using cast and one by using convert function)?
- ERS:

patient detail

pid=1 fname=madhava lname=reddy age=45 bg=o+ve

pid=2 fname=abhinav lname=bandra age=45 bg=o-ve

pid=4 fname=hari lname=kiran age=60 bg=b-ve

pid=3 fname=madhava lname=kiran age=52 bg=o+ve

NULL

pid=6 fname=k_iran lname=kumar age=39 bg=b-ve

pid=2 fname=abhinav lname=bandra age=45 bg=o-ve

pid=7 fname=mahesh lname=nambootri age=36 bg=b+ve

pid=8 fname=rahul lname=kumar age=46 bg=b-ve

pid=9 fname=bharat lname=kumar age=56 bg=b-ve

group by and having clauses

- using group by clause we can group data present in a table based on one or more columns.
- syntax: select
column_names_used_in_group_by_clause_or
_columns_linked_with_aggregate_functions
from table name group by
column1,column2,.....

➤ Using group by clause we can group data based on one or more columns

Syntax:

select c1 from <Table name>group by c1

NOTE:

➤ All Columns specified in select list must be present in group by clause

➤ Select c1,c2 from t1 group by c1,c2 ✓

➤ Select c1,c2,c3 from t1 group by c1,c2 ✗

➤ Select c1,c2,Avg(c3) from t1 group by c1,c2 ✓

select bg from patients group by bg

P_id	Fname	Lname	age	bg

group by lab - 1

- select bg, count(*) as 'count' from patient
group by bg?

group by lab-2

- what is the output for the following query(must show all Intermediate groups created by dbe)?

`select * from patient group by bg`

- what is the output for the following query(must show all Intermediate groups created by dbe)?

`select bg from patient group by bg`

group by lab-3

- identify the output for the following query(must show all Intermediate groups created by dbengine)?

```
select max(age) as 'max age',bg from patient group by bg
```

- identify the output for the following two queries(must show all intermediate groups created by dbengine where ever required)?

```
select * from patient group by bg,lname
```

```
select lname,MIN(age) from patient group by bg,lname
```

group by lab-4

- write a Program for displaying all youngest patients fullname for each blood group?
- ERS:

full name
abhinavbandra
k_irankumar
madhavareddy
mahes%hna...

group by with having lab-1

- identify the output for the following query?

```
select bg, MAX(age) as 'max age' from patient group by bg having MAX(age) > 40
```

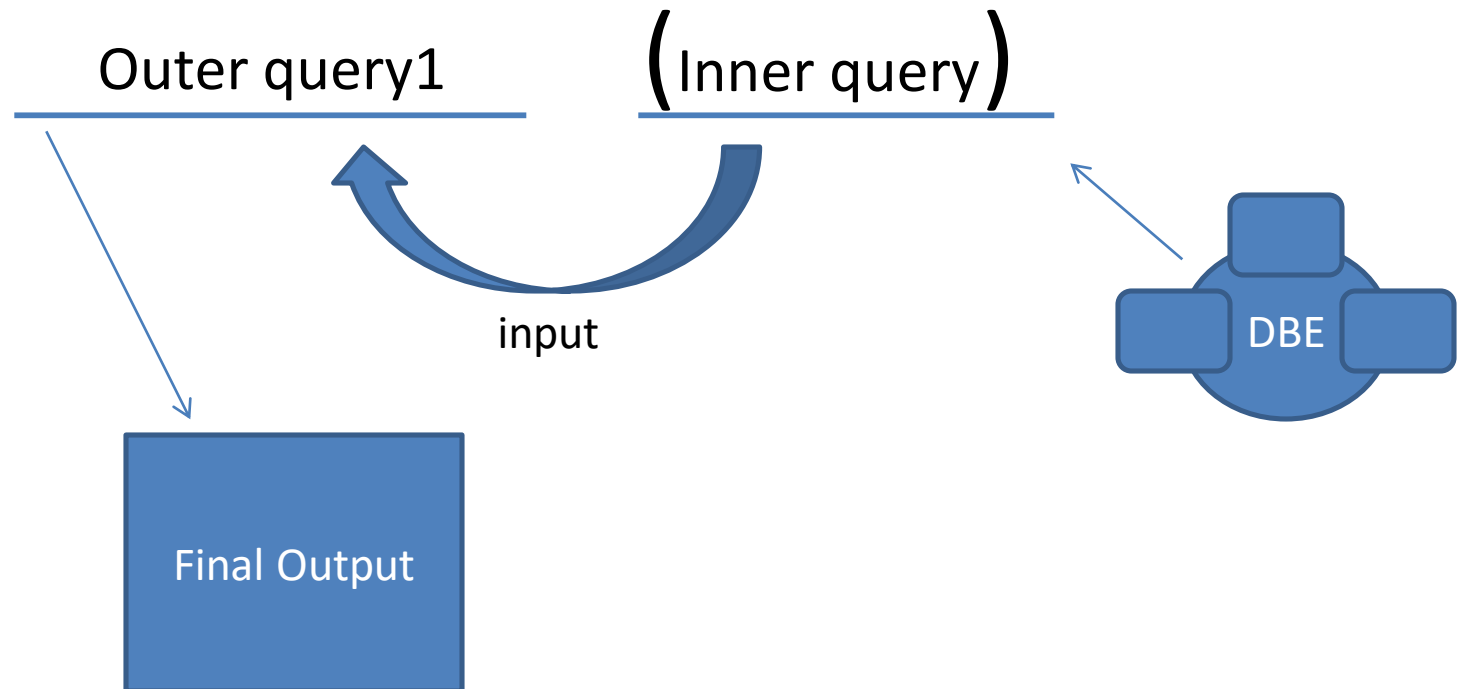

subqueries

- a subquery is a query which is usually written inside insert/update/delete/select statement
- usually inner query or sub query must be a select statement and outer query can be any t-sql statement
- sub queries usually used for identifying unknown value and the same will be substituted into outer query

Non-correlated sub query

- In a non-correlated subquery , the innermost query is executed first.

non-correlated subquery samples.

- Display fullnames of employees whose bg is same as fourth patient's bg.
- Display all employees whose salary is greater than 'db' departments average salary.
- Display all employees whose salary is between Highest paid '.net' dept employee's salary and least paid db dept employee's salary.

non correlated sub queries lab-1

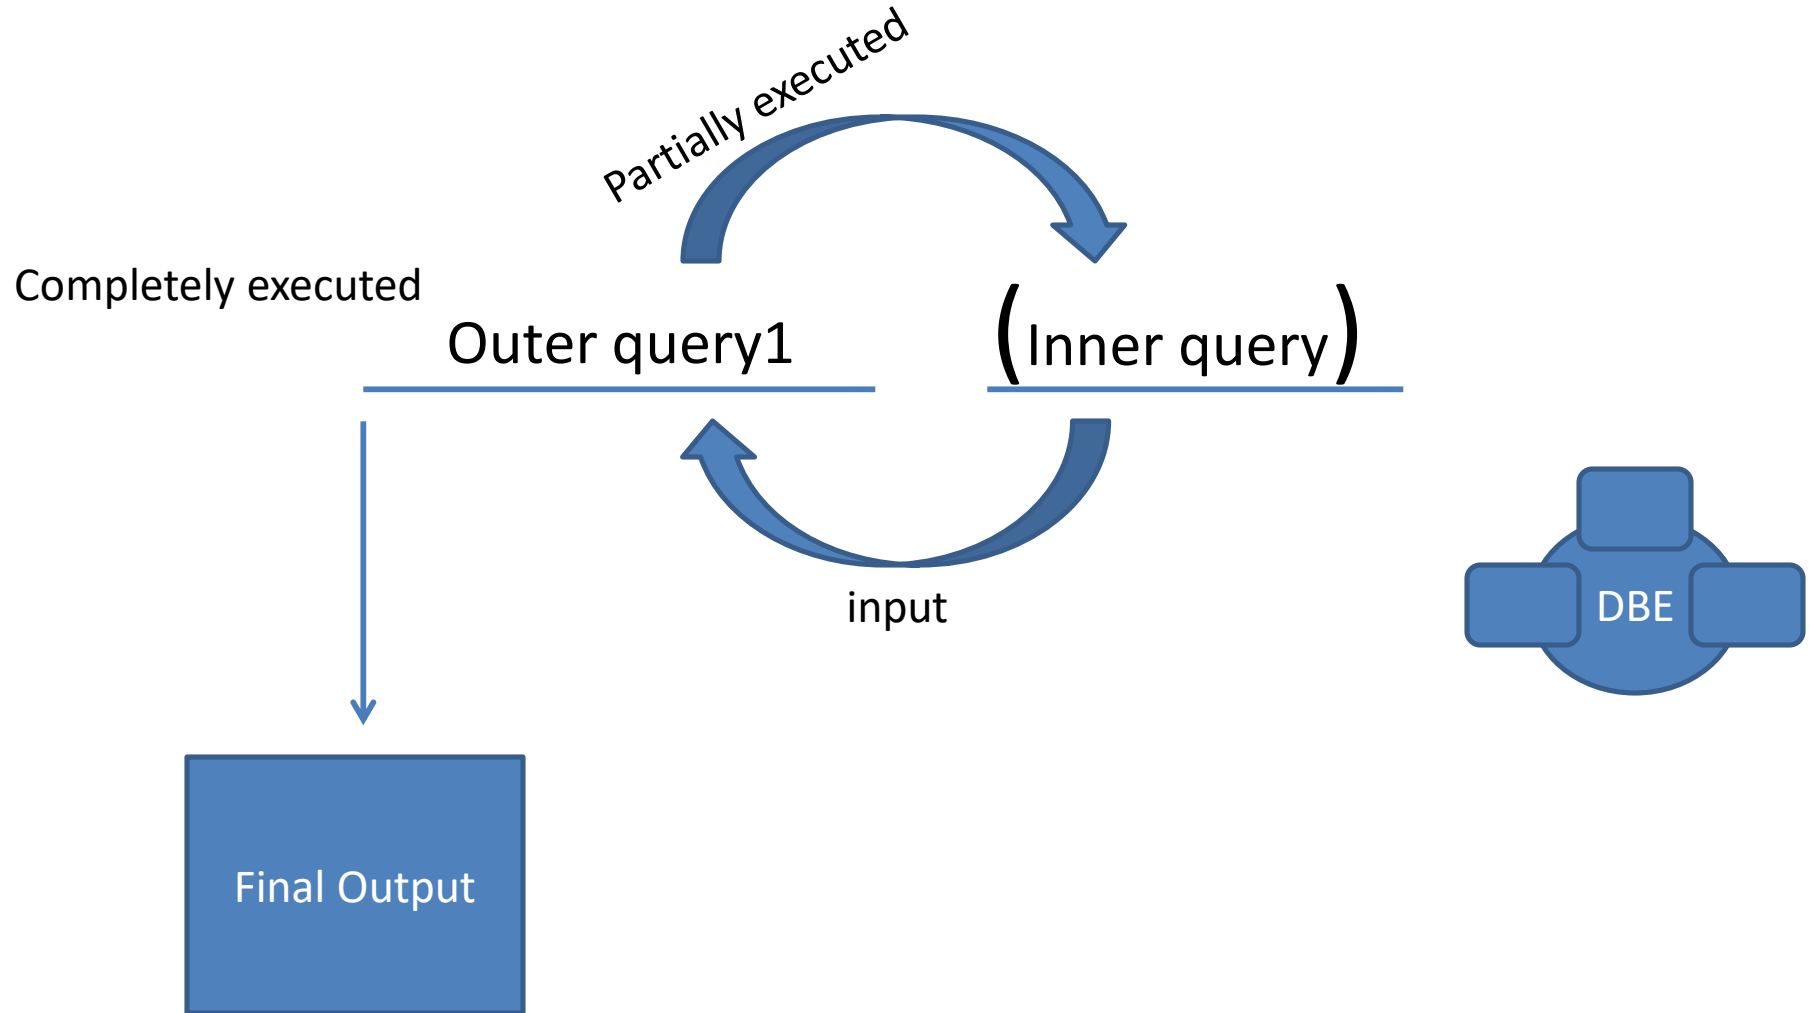

- write a query for displaying all patient details whose age is greater the age of third patient(pid=3)
- write a query for displaying all patient details whose bg is same as 6th patient's bg.
- write a query for displaying all patient details whose age is not same as 1st patients age and 3rd patients age and 9th patient's age
- find the output for the following query?

`select * from patient where age=(select age from patient where pid in (1,3,6))`

correlated sub query

- correlated sub query is a type of sub query where the inner query depends on outer query for its results.

correlated sub query internals

correlated sub query sample

select t1.* from t100 t1 where 1=(select count(*) from t100 t2 where t1.c3<t2.c3)

When no values are greater than the current value,
then the current value is the highest value

Similarly, when there is only one value greater than the
current value, then the current value is second highest

Final result set

c1	c2	c3
3	DD	170

Display the record which is having second highest value
In c3 column

c1	c2	c3
10	AA	160
20	BB	90
3	DD	170

t100 t1

c1	c2	c3
10	AA	160
20	BB	90
3	DD	170
4	HH	280

Diagram illustrating the execution of the correlated subquery. The top table (t100 t1) shows the initial data. The bottom table shows the result of the subquery, where the record with c3=170 (DD) is selected as the second highest value. A blue arrow points from the '3' in the bottom table's c1 column to the '3' in the top table's c1 column, indicating the record being compared.

Correlated sample 2

eid	fname	lname	age	salary	dept	doj
1	rajeev	sukla	23	12000	.net	2011-10-23

employee

Display second highest salary

select salary from employee e1 where 1=

(select count(*) from employee e2 where e2.salary>e1.salary)

Query execution

select salary from employee e1 where 1 =

(select count(*) from employee e2 where e1.salary < e2.salary)

e1.salary < e2.salary

FRS

salary
21800

correlated sub query

- identify the output for the following query (and also write detailed analysis for the same)?

```
select p1.* from patient p1 where 3=( select  
count(p2.pid) from patient p2 where  
p2.age>p1.age)
```

Joins

- using joins we can fetch data from one or more tables into a result set.

inner join

- In inner joins only the matched records(based on condition) from left side table and right side table are added to result set
- **syntax:**

```
_____left_table_name alias1 inner join/join  
right_table_name alias2 on<condition>
```

Inner join/ join sample

Patient1 p

pid	name	bg_id	age
1	madhav	1	24
2	hari	2	27
3	kiran	1	21
4	raj	3	29

Bg b

id	bg
1	o+ve
2	o-ve
3	b+ve
4	b-ve
5	ab-ve

`select p.name,b.bg,p.age from patient1 p join bg b on p.bg_id=b.id`

Final result set

name	bg	age
madhav	o+ve	24
hari	o-ve	27
kiran	o+ve	21
raj	b+ve	29

ERS

name	bg	age
madhav	o+ve	24
kiran	o+ve	21
hari	o-ve	27
raj	b+ve	29

left outer join

In a left outer join , all the data from left side table will be included in the result set ,And only the matched records from the right side table is included to result set .

Wherever there are no match in the right side table , null values are included in the result set

SYNTAX:

Left_table_name **alias** _name **left outer join** right_table_name **alias** _name **on** <condition>

Select **pf.* , p.*** from **profession pf** left outer join **person p** on **pf.pid = p.pid**

Final result set

prof_id	profession	pid	pid	name	age
1	crickter	1	1	shewag	39
3	teacher	4	4	maiik	30
4	politician	2	2	modi	40
5	engineer	3	3	babu	29
6	doctor	10	NULL	NULL	NULL

In left outer join, all left table data must be added to result set

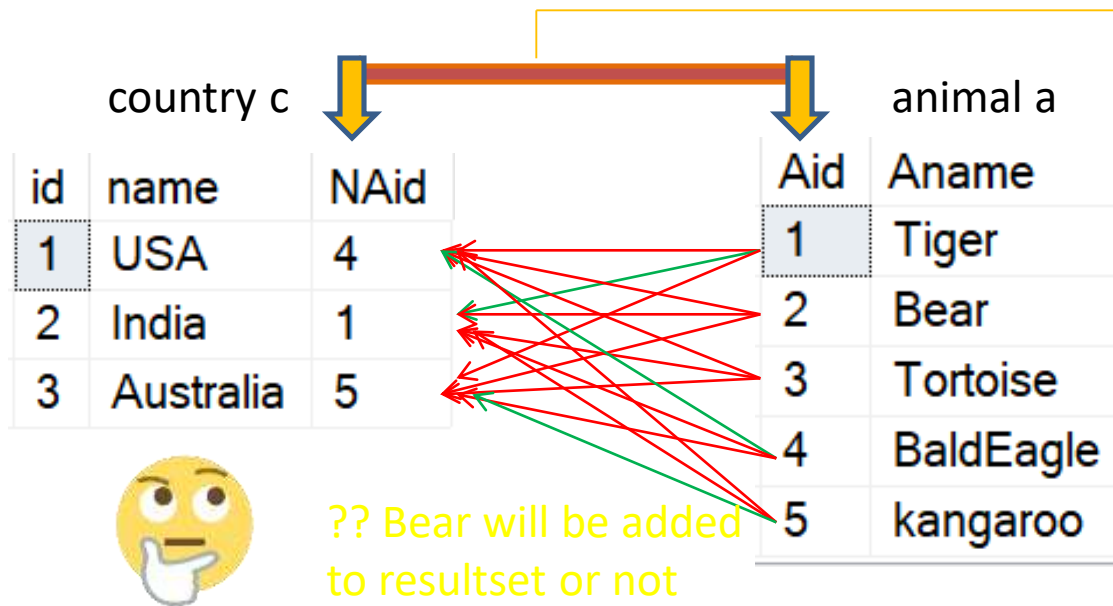

right outer join

In a right outer join , all the data from right side table will be included in the result set ,And only the matched records from the left side table is included to result set .

Wherever there are no match in the left side table , null values are included in the result set

SYNTAX:

Left_table_name **alias** _name **right outer join** right_table_name **alias** _name **on** <condition>

Req: Now I would like to display **all animal names** along with country names if any **matching countries** are present

select c.name, a.aname from country c right join animal a on c.NAid=a.Aid

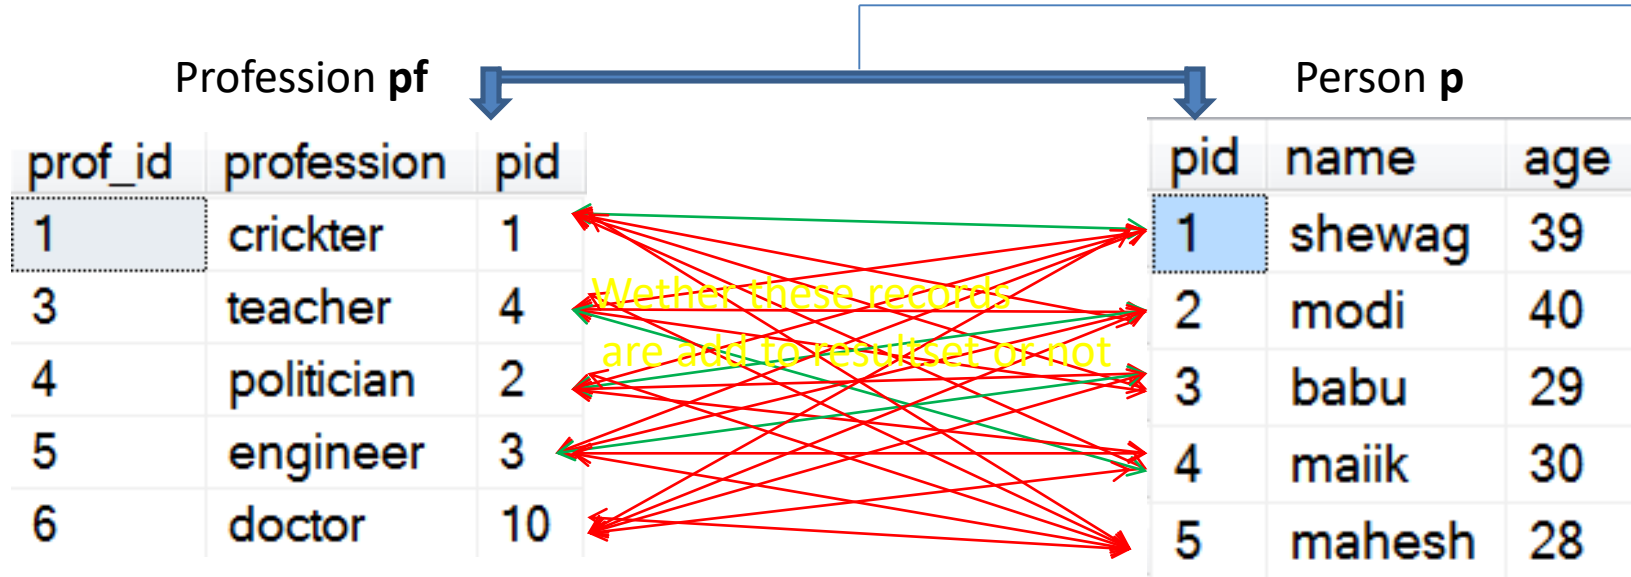

Final result set

name	aname
India	Tiger
NULL	Bear
NULL	Tortoise
USA	BaldEagle
Australia	kangaroo

Full outer join

In case of full outer join all data from both the tables will be added to the result set , irrespective of the condition, Wherever there are no match , null values are included

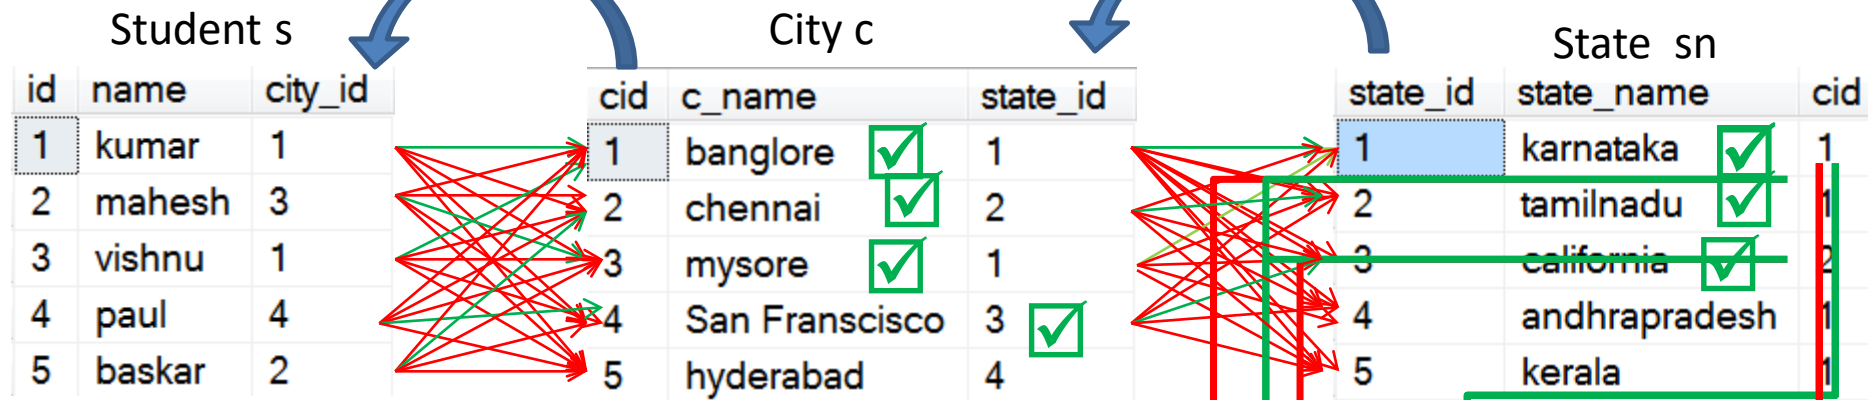

Select pf.* , p.* from profession pf full outer join person p on p.pid=pf.pid

prof_id	profession	pid	pid	name	age
1	crickter	1	1	shewag	39
3	teacher	4	4	maiik	30
4	politician	2	2	modi	40
5	engineer	3	3	babu	29
6	doctor	10	NULL	NULL	NULL
NULL	NULL	NULL	5	mahesh	28

Joining 3 or more tables

select s.name,c.c_name,sn.state_name,cn.country_name from

student s join city c on s.city_id=c.cid

join state sn on c.state_id=sn.state_id

join country cn on cn.country_id=sn.cid

FRS ERS

name	c_name	state_name	country_name
kumar	banglore	karnataka	india
mahesh	mysore	karnataka	india
vishnu	banglore	karnataka	india
paul	San Franscisco	california	united states
baskar	chennai	tamilnadu	india

cross join

- A cross join with where clause will produce same result as inner join
- A cross join without where clause will produce the cartesian products of the tables which are involved in join
- We must use cross join keyword for cross join
- use where clause for specifying cross join condition

NOTE :

Must not use ON keyword for specifying cross join condition

Select p.*,pf.* from person p cross join profession pf
where pf.pid=p.pid

FRS

SiNo	profession	pid	pid	name	age
1	Cricketer	1	1	seh wag	39

self join

- joining a table to itself called as self join
- we use inner join for self join (no special keyword for self join)
- we must use different alias names for same table while comparing same table with itself

select e1.name as 'employee',e2.name as 'manager' from emp_mgr e1
 join emp_mgr e2 on e1.mgr_id=e2.eid

employee	manager
ravi	suresh
suresh	mahesh
mahesh	kiran
hari	ravi

Req: display all employee and manager names , where the employee's experience are greater than their managers

Emp_mgr e1

eid	name	mgr_id	exp
1	ravi	2	9
2	suresh	4	6
3	kiran	NULL	16
4	mahesh	3	26
5	hari	1	3

Emp_mgr e2

eid	name	mgr_id	exp
1	ravi	2	9

state

inner joins lab-1

- identify the output for the following queries?

```
select  fp.f_name, fp.l_name, s.s_name from famous_people fp
inner join state s on fp.state_id=s.s_id
```

```
select  fp.f_name, fp.l_name, s.s_name from famous_people fp
inner join state s on fp.state_id!=s.s_id
```

```
select  fp.f_name+' '+fp.l_name+ ' is not from '+ s.s_name as 'result'
from famous_people fp inner join state s on fp.state_id!=s.s_id
```

```
select  fp.f_name, fp.l_name, s.s_name from famous_people fp
inner join state s on len(fp.f_name)>s.s_id
```

outer joins

- identify the output for the following queries?

```
select  fp.f_name, fp.l_name, s.s_name from famous_people fp  
left join state s on fp.state_id=s.s_id
```

```
select  fp.f_name, fp.l_name, s.s_name from famous_people fp  
right join state s on fp.state_id=s.s_id
```

```
select  fp.f_name, fp.l_name, s.s_name from famous_people fp  
right join state s on fp.state_id>s.s_id
```

self joins lab-1

eid	name	mgr_id	exp
1	ravi	2	9
2	suresh	4	6
3	kiran	NULL	16
4	mahesh	3	26
5	hari	1	3

employee_manager

- write a query for finding all employee names whose exp is greater than their managers exp?
- write a query for displaying all employee names along with their manager names if any (the result set must also contain kiran)

stored procedures

- stored procedure is almost same as function/method in normal programming languages.
- a stored procedure is a compiled query (**query whose execution plan is cached**)
- a sp can take 0 or more inputs and can return 0 or more out puts.

Types of stored procedures

Output:

- 1) Using select statements
- 2) Output parameters
- 3) Return statement

Note: we can return only integer values using return statement

SP Syntax

Syntax:

Create proc\procedure<proc name>

(

@vn datatype[(size)],

@vn datatype[(size)],

)

as

begin

----- any conditional statements/ loops / variables....

T-sql statements(dql\ddl\dml\tcl)

end

Calling sp:

exec spname _____, _____, _____,

Stored Procedure sample

- write a sp with the name getpatient to get all patient details from table

```
Create procedure getpatient  
As  
Begin  
Select * from patient  
end
```

Calling sp:

```
exec getpatient
```

output

	pid	fname	lname	age	bg
1	1	Madhava	Reddy	45	O+ve
2	2	Abhinav	ban...	45	O-ve
3	4	Hari	Kiran	60	B-ve
4	3	Madhava	Kiran	52	O+ve
5	5	veena	kum...	42	NULL
6	6	K_iran	Kum...	39	B-ve
7	2	Abhinav	ban...	45	O-ve
8	7	Mahes...	Nam...	36	B+ve
9	8	Rahul	Kum...	46	B-ve
10	9	bharat	Kum...	56	B-ve

Stored Procedure sample 2

- write a sp with the name insertemployee for inserting new employee into employee table (the sp must take @eid, @fn, @ln, @age, @sal, @dept and @doj as input parameters)

```
create proc insertemp1
(
@eid int, @fn varchar(40), @ln varchar(40), @age int,
@sal int, @dept varchar(40), @doj date
)
as
begin
insert into employees01 values (@eid, @fn, @ln, @age, @sal, @dept, @doj)
end
```

Calling sp:

```
exec insertemp1 10, 'harish', 'rao', 45, 23100, 'android', '10-05-2014'
```

Stored Procedure Lab-1

- write a sp with the name insertpatient for inserting new patient into patient table (the sp must take @pid, @fn, @ln, @age and @bg as input parameters)

User defined function

- User defined function is similar to a stored procedure
- User defined function contains set of compiled t-sql statements (which is similar to stored procedures)
- User defined functions supports only input parameters but not output parameters
- An udf can't contain any t-sql statements which alters current state of data base.
- User defined function is not allowed to call any stored procedure

udf vs sp

SP	UDF
Supports input & output parameters	Supports only input parameters
Can write any type of sql queries	Can't write sql queries which modifies state of db (ex. insert/update/delete/create etc..)
Sp can call UDF	Udf can't call sp

indexes

- using indexes we can quickly find the information from a table or from an indexed view

Types of indexes

clustered index

- In a clustered index , the actual table is stored in the leaf pages of b-tree [binary tree]
- Only 1 clustered index is possible per table

syntax :-

create clustered index <index_name> on <table_name> (column1,column2..)
